

ChatVid AI

ChatVid AI

Ever wish your video could answer back? Now it can.

A multimodal video-analysis system that lets users chat with YouTube videos

Headstarter SWE Residency Sprint 2 | May 2025

by Misbah Ahmed Nauman

Problem & Motivation

Why We All Struggle With Videos

Ever watched a 10-minute lecture and wasted 3 minutes scrubbing around just to find that one key concept?

Current Frustrations

- Endless Scrubbing: You drag the bar back and forth, hoping to land on the right moment.
- Disconnected Tools: You might open a transcript-only site –but then you can't click a timestamp to watch.
- Missing Visual Search: "I know I saw a red car at 2:15... but where?"

Sections

0:00 – Intro to shade balls and questions

1:07 – Driving a boat through shade balls

3:01 – Bromate, the reason for shade balls

5:31 – Original purpose and material

7:49 – Driving, algae, and evaporation

10:05 – Cost, other shapes, and boba

Visual search: e.g. "red car"

Search

Ask a question about the video...

Send

Solution Overview

Fetch YouTube Transcripts

Using youtube-transcript-api to extract text content

AI-Powered Summaries & Q&A

Generate timestamped summaries and handle questions

Extract Visual Data

Use yt-dlp + OpenCV to capture frames every 5 seconds

Present in React Frontend

Next.js + TypeScript + Tailwind for seamless experience

System Architecture

Frontend (Next.js)

Two main routes: Single-page app with two views

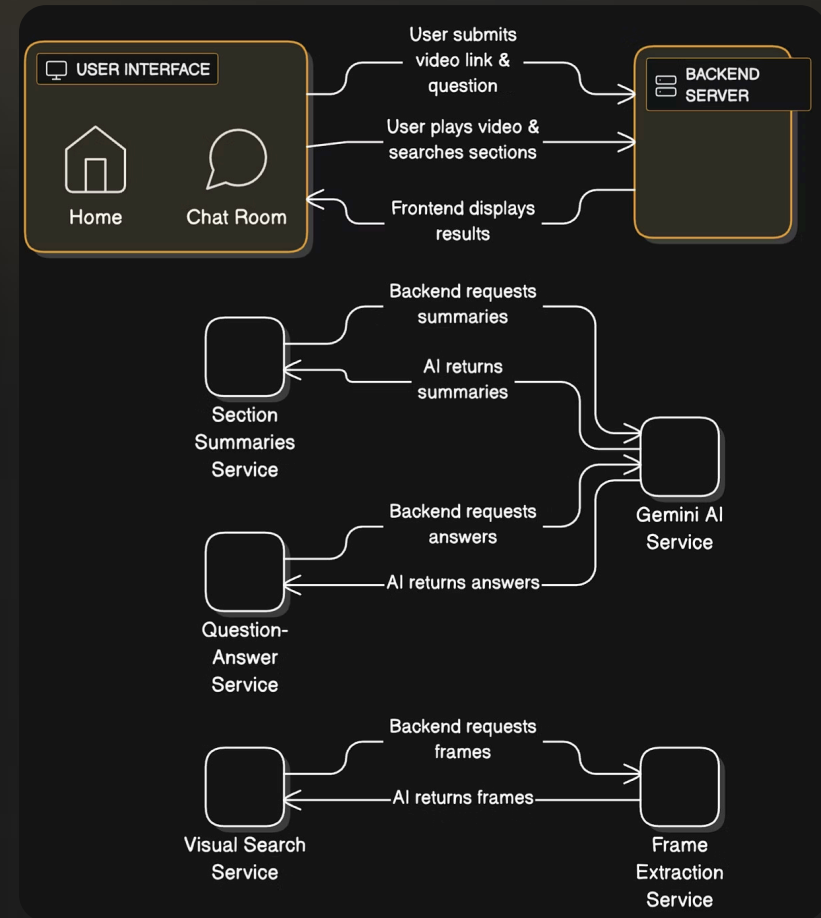

- **Home:** paste your YouTube link + AI key
- **Chat Room:** video player, searchable sections, chat box, and visual search.

Backend (FastAPI)

Routes: Transcript Service, Section Summaries Service, Question-Answer Service, Visual Search Service

Third-party Services

YouTube API, Gemini API, yt-dlp + OpenCV for frame extraction

Key Features

Timestamped Sections

Automatically divides videos into navigable sections with summaries

JSON Structure

Clean data format for sections, timestamps, and search results

Chat with Video

Ask questions about content with timestamped hyperlink answers

Visual Frame Search

Find specific visual elements across the entire video

Challenges & Solutions

Async Frame Embeddings

Switched from blocking CPU to `asyncio.gather()` with `httpx.AsyncClient`

Timestamp Seeking

Replaced unreliable `ReactPlayer` with native `iframe`

Gemini Integration

Leveraged multimodal capabilities instead of juggling separate models

Prompt Engineering

Crafted precise prompts for structured JSON responses

What's Next?

Can we tell you who's speaking?

Yes—speaker labels are coming soon

Want to compare two videos?

Future updates will let you query multiple URLs at once

Ready to save your chat history?

Next version will let you review past Q&A sessions anytime
